

Instruction Sheet - Water Device 1"

Please give this instruction sheet to your licensed plumber!

Your new Water Device is entirely maintenance-free. It can be installed vertically and horizontally with water flowing through from either direction. Do not install outside or in locations where the temperature drops below freezing.

To keep your beautiful device looking good for generations to come, use proper tools. A crescent wrench (toothless) with at least a 1¾ inch opening is recommended when connecting your Water Device.

Your Water Device has standard 1 inch NPT threads. Your plumber will provide compatible fittings based on the type and size of your pipe.

For a tight, drip-free seal, a combination of Teflon tape and a non-setting pipe thread sealant, like T Plus 2 from Rectorseal, is recommended. Once tape and sealant have been applied be sure not to melt them with soldering.

If a drip free seal is not achieved using standard sealants, we recommend purchasing hemp sealant. You'll find it on Amazon / Google by typing in "Plumbers Plumbing Flax Hemp Pipe Fittings."
